Earnings calls summary: Forward R&D agendas

Selected topics singled out by management or explored in Q&A | assets, combinations, disease settings and technology platforms

Q3 2026 earnings call | 30 October 2026

Broaden ADC–IO partners and combination options
Ivonescimab (PD-1/VEGF bispecific) + sone-ve (CLDN18.2 ADC) / Datroway (TROP2 ADC): GI trials expected imminently. Own IO pivotal data: H2 2027; further puxi-sam (B7-H4 ADC) combinations planned.

Keep the EGFR backbone through progression
Orpathys (MET TKI) / Datroway (TROP2 ADC) + Tagrisso (EGFR TKI) across first line and progression; TROPION-Lung14 / 15 remain key development programmes.

Build oral combinations for overlapping metabolic disease
Laroprovstat (oral PCSK9i) / rosuvastatin (HMG-CoA reductase inhibitor): Phase III data in 2027. GLP-1/SGLT2 development; GLP-1/PCSK9 remains exploratory.

Plan Imfinzi subcutaneous before LOE
Imfinzi (anti-PD-L1 mAb): SC launch expected before LOE to support earlier settings; no calendar launch date specified.

Invest in cell therapy / TCEs beyond current haematology use
Advance AZD0120 (CD19/BCMA CAR-T) / surovatamig (CD19/CD3 TCE) and autoimmune trials; invest in in-vivo cell therapy, with no named candidate stage / timing.

Build cancer-vaccine capability internally for now
Asked about personalized cancer vaccines and partnering, CEO points to internal development using infectious-disease capabilities; no modality, stage or firm timeline disclosed.

H1 2026 earnings call | 27 July 2026

Build an EGFR combination franchise
Tagrisso (EGFR TKI) + Orpathys (MET TKI) in MET-driven resistance; Datroway (TROP2 ADC) + Tagrisso across first / second line (TROPION-Lung14 / 15).

Move ADCs upstream; use biomarkers in pivotal design
Sone-ve (CLDN18.2 ADC): first-line IO combinations / wider GI exploration. Datroway (TROP2 ADC): AVANZAR incorporates ITT and biomarker-positive testing.

Extend SERDs into adjuvant breast cancer
Camizestrant (oral SERD): CAMBRIA-1 targets intermediate-/high-risk HR+/HER2− disease after 2–5 years of endocrine therapy, with or without prior CDK4/6 inhibition.

Target high-risk cardiorenal disease with combinations
Plan ELEVATE for elecoglipron (oral GLP-1RA) in HFpEF / CKD on dapagliflozin (SGLT2i); develop add-on mechanisms for high-risk CKD / heart failure.

Advance inhaled respiratory approaches
Discuss Phase III plans for inhaled sunakiment / AZD8630 (anti-TSLP Fab) with Amgen; develop an inhaled PDE3/4 inhibitor for COPD.

Test amyloid depletion on top of ATTR standard of care
Ciramitug (TTR amyloid-depleting mAb): add-on development on ATTR standard of care, seeking mortality / cardiovascular-event benefit.

Focus: stated next steps and development rationale. Exploration, trial plans and confirmed execution are kept distinct; expectations are dated to each call.
